Conclusion

Motivation

- First point goes here.
- Second point goes here.
- Third point goes here.

Model

Let $X_1, \dots, X_n$ be observations. We assume

$$X_i \mid \theta \stackrel{\text{iid}}{\sim} p(x \mid \theta),$$

and place a prior $\pi(\theta)$ on the parameter of interest.

The posterior is then

$$\pi(\theta \mid x_1, \dots, x_n) \propto \pi(\theta) \prod_{i=1}^n p(x_i \mid \theta).$$

Algorithm

Key Step

Something important to highlight.

1. Initialize parameters.
2. Iterate until convergence.
3. Report results.

Figure Example

Figure: A clear, descriptive caption.

Table Example

Table: Comparison of methods.

Method	Metric A	Metric B
Baseline	0.82	0.75
Proposed	0.91	0.88

Summary
